

Storm Drain Stenciling is a very good way to remind your neighbors that storm water flows untreated to our creeks and river. Many people assume that the water is treated like other household or commercial wastewater but that is not the case.

When rainfall or snow melt runs off of an impervious surface it picks up and carries a wide variety of pollutants into our storm water system. These pollutants then flow into our local waterways. Some examples of storm water runoff pollutants include:

Detergent	Fertilizer
Pet Waste	Leaves
Grass Clippings	Motor oil
Antifreeze	Cleaners
Paints	Pesticides
Sediment	Plastic

The city encourages volunteer groups, such as scouts, high school students, or other special interest groups to organize a stenciling project.
